

A CLI(Command Line Interface) and a GUI(Graphic user Interface) are both very important parts of being able to navigate a computer and learning more about them in general. Both of them are very useful and are used for very different things that accomplish different tasks. CLI is much different compared to GUI mainly because CLI is used more in response to prompts that are displayed that you respond to and GUI is used to interact with graphic icons that allow you to do certain actions. Despite the ways that they are used differently they also work well in conjunction with each other to accomplish their different tasks.

In my personal opinion, I enjoy using GUI more the CLI. After all, I find that using GUI is much more efficient than trying to struggle through using CLI because I find that it is much more complicated than learning what GUI is and how to use it. Many of the other reasons I think this is because GUI is also a fundamental part of modern-day computers and is almost always in use compared to CLI which is rarely used unless you have prior knowledge of how to use it because it can be very difficult for people to understand it in its entirety. CLI is also in my opinion not very beginner friendly and you would have to know what commands to put in and especially know what all of those commands do which can be very difficult for beginners to pick up and understand.
